AA003501-AA003557 represent novel human protein kinases #1-57. The novel protein kinases have been identified as members of the tyrosine or serime/threonine kinase (TYK and STK) familites. The polymucleotides may be used in the protein kinases and the polymoptides may be used in the protein kinases and treatment of diseases associated with imappropriate kinase expression. For example, they may be used to treat cancers (especially cancers of hemacopoietic origin), ardiovascular disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), immune related diseases (e.g. theumatory disorders (e.g. diabetes), associated diseases (e.g. theumatory disorders (e.g. asthma), infectious disease (e.g. HIV) and reproductive disorders (e.g. asthma), infectious additionally, polymucleotides encoding protein kinases may be used as antigens in the production of antibodies against the protein kinases and in assays to identify modulators of protein kinase expression and activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
syndrome (AIDS), Addison's disease, allergy, anaemia, asthma, Crohn's disease, Theumaroid arthritis), a growth and developmental disorder (e.g. bursitis, cirrhosis, hepatitis, psoriasis, Cushing's syndrome), a cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, caucher's disease). Niemann-Pick's disease). PKIN is useful in a number of drug screening techniques and to analyse the proteome of a tissue or cell type. PKIN is useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation, inversion, corbes for mapping naturally occurring genomic sequences. PKIN is useful in southern or northern analysis, dot blot or other membrane-based technologies, in probes for mapping naturally occurring genomic sequences. PKIN is useful in southern or northern analysis, dot blot or other membrane-based technologies, in the disease from patients to detect altered PKIN expression. The present sequence is human PKIN-15.

cancer-associated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with prostate cancer-associated polynucleotides (designated Porgenes) that constant cancer-associated polynucleotides at least 80% identical contactively hybridise to a sequence that is at least 80% identical contact the prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit in dentifying modulators of prostate cancer or agents that inhibit in gene therapy, as a vaccine or in sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.

Abg61800-Abg61944 represent prostate cancer-associated proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes novel vif proteins (AAY01969-88) and the genes encoding them (AAX35271-36). The vif gene is an accessory gene for HIV-1 that has low functional mutagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce
                                                                                                                                                                                                             (ABBS7737-ABB72072). This patent did not form part of the printed The sequence data for this patent did not format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Consensus sequence; attenuated; non-functional; accessory protein; vif;
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                           13; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New attenuated vif (viral infectivity factor) genes, used in genetic vaccines against HIV-1
                                                                                                                                                             insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a polypeptide described in the disclosure of the invention.
                                                                                                                                                                                                                                                                9

                                                                                                                                                                                                                                                                                                    22 FDVMREALLRVKSSERLAMLRALAGMCGHRVLP----GTGAS------AIAATVTPKG 69
immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce vaccine that has a broad immune response against all viral components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vif could limit both viral escape and contribute to lowering the viral set point during early infection stages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids having the sequences of clones isolated from libraries of different human tissues, useful in recombinant DNA methodologies -

'n The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, mimunosuppressant and cytostatic activity. The polynuclectides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the 604 EVTQEFTQYWAQREADFKETLLQERE-ILEENAERRLAIFKDLVGKCDTREEAAKDICAT 662 62 AATVTPKGASMKLKPPRPQSTKSPELRELSRKIREMNKTISQESARV------ 108 Human, nootropic, immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; hamenostatic; amyotrophic lateral sclerosis; SNy-Drager Syndrome; chemotactic; chemokantic; thrombolytic; drug screening; arthritis; inflammation; Ď. The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, mimunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system, such as peripheral nervous injuries, peripheral nervous localised neuropathies and central nervous system diseases, and as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, as sassays for receptor activity, atthritis and inflammation, leukaemias and assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.
Note: The sequence data for this patent did not form part of the printed

WPI; 2001-639362/73. N-PSDB; AAS82497 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity

The invention relates to isolated polynucleotide (I) and properiod (II) sequences. (I) is useful as hybridisation probes, CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The confidence is an electrical in gene therapy techniques (C for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving correct or an electricating an applyagation in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical cisorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in corresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences. The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in dispnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | : : | : | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | : | :

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a DNA sequence (I, ABN81604-ABN81605), containing a sequence based on that of (I) but with some bases deleted, added, inserted and/or substituted and encoding a protein (ABB83792-ABB83793) with decaprenyl diphosphate synthase activity or hybridisable with (I) under stringent conditions and encoding a protein with decaprenyl diphosphate synthase activity. The DNA is useful for production of coenzyme (10 for application in drugs. The coenzyme is simply produced on industrial scale, efficiently, with significantly
                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Microbial production of coenzyme Q10 by transformants transferred with fungal decaprenyl diphosphate synthase gene, on industrial scale for application in drugs

The invention provides protease inhibitors which inhibit lentiviral or retroviral replication where the inhibitor comprises an amino acid sequence which corresponds to an amino acid sequence in a lentiviral Vif protein. The protease inhibitors can be used for the prevention or treatment of lentiviral or retroviral infection, e.g. those resulting from HIV-1, HIV-2, simian immunodeficiency virus, bovine immunodeficiency virus, bovine immunodeficiency virus, bovine immunodeficiency virus DNA encoding the peptides can also used in such methods. The present sequence represents an example of a peptide inhibitor of the invention derived from the HIV-1 Vif protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22 FDVMREALLRVKSSERLAMLRALAG------MCGHRVLPGTGASAIAATVTPKGASM 72
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    16 FDCFSDSAIR------KALLGHIVSPRCEYQAGHNKVGSLQYLALAALITPK---- 61
Protease inhibitor; lentiviral; retroviral; replication; Vif protein; simian immunodeficiency virus; feline immunodeficiency virus; HIV-1; bovine immunodeficiency virus; infection; HIV-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New protease inhibitors comprising a sequence of lentiviral Vifwhich inhibit lentiviral replication, used for treating or preventing infection, particularly by HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               VIF-derived HIV protease inhibitor C'Vif (residues 97-192).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Match 10.9%; Score 77; DB 20; Length 96; Local Similarity 27.9%; Pred. The vif gene is an accessory gene for HY-1 that has low functional matagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HV-1 genes to produce vaccine that has a broad immune response against all viral components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vif could limit both viral escape and contribute to lowering the viral set point during early infection stages. 22 FDVMREALLRVKSSERLAMLRALAGMCGHRVLP----GTGAS-----AIAATVTPKG 69 Consensus sequence, attenuated, non-functional, accessory protein, vif, viral infectivity factor, ${\rm HIV}\textsc{-}1$; vaccine. 38; Gaps New attenuated vif (viral infectivity factor) genes, used in genetic vaccines against HIV-1 70 ASMKLKPPRPQSTKSPELRELSRKIREMNKTISQESARVNHRLPEGH 116 ---KIKPPLPSVRKLTEDR-----WNKPQKTKGHRGSHTM-NGH 192 Length 192; 29; Indels Query Match 10.9%; Score 77; DB 20; Best Local Similarity 29.9%; Pred. The vif gene is an accessory gene for HIV-1 that has low functional mutagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce vaccine that has a broad immune response against all viral components, and which minics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vifucing early infection stages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Consensus sequence; attenuated; non-functional; accessory protein; vif; viral infectivity factor; \mathrm{HIV}-1; vaccine.

9 The specification describes novel vif proteins (AAY01969-BB) and the genes encoding them (AAX35217-36). The vif gene is an accessory gene for HIV-1 that has low functional mutagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce vif genes may be used in concert with other HIV-1 genes to produce components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vif could limit both viral escape and contribute to lowering the viral set point during early infection stages. 22 FDVMREALLRVKSSERLAMLRALAGMCGHRVLP----GTGAS-----AIAATVTPKG 69 Consensus sequence; attenuated; non-functional; accessory protein; vif; 38; Gaps New attenuated vif (viral infectivity factor) genes, used in genetic vaccines against HIV-1 70 ASMKLKPPRPQSTKSPELRELSRKIREMNKTISQESARVNHRLPEGH 116 ---KIKPPLPSVRKLTEDR-----WNKPQKTKGHRGSHTM-NGH 192 Length 192; Score 77; DB 20; Length 19 Pred. 112 PDCFSESAIR------KAILGHRVSPRCEYRAGHSKVGSLQYLAIAALITPK- 157 69 The specification describes novel vif proteins (AAV01969-88) and the genes encoding them (AAX5217-36). The vif gene is an accessory gene for HIV-1 that has low functional mutagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce vaccine that has a broad immune response against all viral components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vif could limit both viral secape and contribute to lowering the viral set point during early infection stages. 22 FDVMREALLRVXSSERLAMLRALAGMCGHRVLP----GTGAS-----AIAATVTPKG 38; Gaps attenuated vif (viral infectivity factor) genes, used in genetic nsus sequence; attenuated; non-functional; accessory protein; infectivity factor; HIV-1; vaccine. New attenuated vif (viral infectivity factor) genes, used in genetic vaccines against HIV-1

WPI; 1999-263380/22.

vif could limit both viral escape and contribute to lowering the viral set point during early infection stages.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an antigenic composition comprising an isolated primate lentivirus whose genome contains an engineered non-revertible null mutation in the nef gene, or an infectious DNA clone in a carrier. The antigenic composition is used in vaccines against infection by the lentivirus, e.g. AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          72

The invention relates to a peptide fragment comprising of amino acid sequences corresponding to sequences within the processed gp120 of HIV-1 isolate BHIO (Genbank accession M15649'. The peptides are useful in the detection, prevention and treatment of HIV-1 infections, and in AIDS therapy. The antibodies are especially useful as vaccines for active and passive immunization, or for the detection and/or determination of HIV-1 infected cells and/or HIV-1 viruses. The present sequence represents the (GenBank accession M15654). New anti-idiotypic antibodies consisting of one or both amino acid sequences corresponding to amino acid positions 79-84 or 326-400 of the processed gpl20 of HIV-isolate BH10, useful as vaccine against HIV-1 , Buchacher A, Ernst W, Ballaun C, Purtscher M; Predl R, Schmatz C, Klima A, Steindl F, Muster T; HIV-1; gp120; BH10; vaccine; immunization; vif protein Amino acid sequence of HIV-1 isolate BH10 vif protein. Purified glyco:protein and peptide(s) - are recognised by sera contg. antibodies against lymphadenopathy virus and useful in detecting AIDS antibodies or in vaccines

Disclosure; Fig 4; 75pp; English.

The inventors claim a polypeptide which is recognised by sera of human origin contg. antibodies against the virus of lymphadenopathies (LAV) or acquired immune deficiency syndrome (AIDS). ABO claimed are various peptides corresp. to the AA sequences deducible from proteins encoded by LAV DNA, defined by specific residues (e.g. 12-32, 37-46, 49-79, 88-153) in accordance with a formula given in the specification.

                                                                                                                                                                                                                                                                                                                                                                     A fragment of DNA approximately 200-500 base pairs in length is ligated into a vector and used to transform E.coli. These cells then express a polypeptide which is immunoreactive with HTLV-III-specific antibody. The HTLV-III polypeptides can be used for the production of antibodies, in immunoassays for the detection of HTLV-III specific antibodies and in vaccines for the prevention of AIDS. The antibodies can also be used to detect HTLV-III polypeptides. (Updated on 25-MAR-2003 to correct PM field.) (Updated on 25-MAR-2003 to correct PF field.)

The present invention relates to a chemically synthesised env peptide of Human Immunodeficiency Virus (HIV) of less than 150 amino acid residues. Such a peptide is useful in an in vitro diagnostic method for the catching the persence or absence of antibodies that bind to antigens of HIV-1 retrovirus, by contacting the peptide with a biological fluid for form a peptide-antibody complex, detecting the formation of the peptide-antibody complex by comparing the formation of the peptide-antibody complex is correlated with the presence of antibodies that bind to antigons of HIV-1 retrovirus in the biological sample. Where the peptide-antibody complex is correlated with the presence of antibodies that bind to antigens of HIV-1 retrovirus in the biological sample. It can also be used for preparation of vaccine compositions against AIDS or related syndromes. The present sequence is the lymphadenopathy-associated virus LAV ORF Q protein. The LAV virus was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human prostate cancer associated antigen protein sequence SEQ ID NO:1216.

Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g.

Example 1; Page 747-748; 799pp; English

AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively.
AAB63222 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,

Nucleic acids encoding histone fusion proteins useful for the prevention, diagnosis and treatment of disorders associated with cell proliferation and inflammation -

Claim 1; Fig 1; 29pp; English.

This sequence represents human histone fusion protein HHFP. Nucleic acids encoding HHFP were first identified in a human breast tissue CDNA library and this sequence represents a consensus. HHFP is a naturally occurring protein which contains regions homologous with both histones and nonhistone proteins. The N-terminus of HHFP resemble the full-length human histone H2A, while residues 133.161 are highly basic and have similarity with the C-terminus of histone H1, indicating that HHFP has DNA binding potential. There is a leucine zipper region in the

The present sequence represents a human histone fusion protein (HFP). The protein regulates the conformational changes of DNA. HFP nucleic acids were first identified in Incyte clone 2297753 from a breast tissue cDNA library. HFP is useful for diagnosing, preventing or treating disorders associated with cell proliferation (e.g. sarcoma, lowmeania, or bone, colon or brain cancer) and inflammation (e.g. allergies, asthma, bronchitis, lupus erythematosus, multiple sclerosis or thyroiditis).

```
The invention comprises a method for detecting an androgen-independent cancer cell in a sample from a patient who has undergone androgen ablation therapy. The method involves determining the presence or absence of nucleic acids that are either up-regulated or down-regulated in prostate cancer. The method is useful for detecting an androgen-independent prostate cancer cell in a sample from a patient who has undergone androgen ablation therapy. The method is particularly useful for diagnosing androgen-dependent prostate cancer, prostate cancer undergoing androgen withdrawal, or androgen-independent prostate cancer. The present amino acid sequence represents a protein which is encoded by a gene that is either up-regulated or down-regulated in prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      diagnosing androgen-dependent prostate cancer cell in a sample presence or absence of genes whose expressions are up- or down-regulated --
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 203; 210pp; English

Drosophila melanogaster polypeptide SEQ 1D NO 15573

Drosophila; developmental biology; cell signalling; insecticide;

Drosophila melanogaster

WO200171042-A2

23-MAR-2001; 2001WO-US09231

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell.cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01879-ABB12072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. Sequence 3199, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: APPLICATION NUMBER: US/08/252,991A
CURRENT APPLICATION NUMBER: US/08/252,991A
CURRENT PILING DATE: 1999-02-18
PRIOR PELICATION NUMBER: US 60/074,788
PRIOR PELICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEGO ID NO 32190
LENGTH: 231
APPLICANT: Marc J. Rubenfield et al.

GENERAL INFORMATION:
APPLICANT: Macc J. Rubenfield et al.
ATTLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TILLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TILLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US 60/094,788
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 32808
LENGTH: 248

Patent No. 6551795
GENERAL INFORMATION:
TOTALE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINGS FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ABRUGINGS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
PRIOR PLILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-07-27
NUMBER OF SEQ ID NOS: 33142
LENGTH: 329
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS FILER REFERENCE: 107196.118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 2, Application US/09168590
Patent No. 6187563
GENERAL INFORMATION:
TITLE OF INVENTION: INTERACTING POLYPEPTIDES FOR
TITLE OF INVENTION: AUTOANTIGENS OF AUTOIMMUNE DISEASES;
FILE REFERENCE: 101918-200 (OCR-941)
CURRENT APPLICATION NUMBER: US/09/368,590
CURRENT PILING DATE: 1999-08-04
BEARLIER APPLICATION NUMBER: 60/095,657
NUMBER OF SEQ ID NOS: 8
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Indels
                                                                                                                                                                                                                                                                                                                                                   67;

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: MARC J. Rubenfield et al.
APPLICANT: MARC J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AERUGINOSA POR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-02-18
PRIOR PILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 19038
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             32 VKSSERLAMLRALAGMCGH-----RVLPGTGASAIAATVTPKGASMKL----KPP 77

SEQUENCEAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: NUMBER: US/09/252,991A

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT PILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 24804

I ENGTH: 184

Patent No. 6228601
GENERAL INFORMATION:
                                                                                                                                                          LELEX: 904136
INFORMATION FOR SEQ ID NO: 8:
SEQUENCE CHARACTERISTICS:
LENGTH: 643 amino acids
TYPE: amino acid
TOPOLOGY: line-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            : 643 amino acids amino acid
  CURRENT APPLICATION DATA:
                                                                                                                                                                                                                                                                                                         , MOLECULE TYPE: protein US-08-216-894-8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TYPE: amino acid
TOPOLOGY: linear
MOLECULE TYPE: protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FILING DATE:

Sequence 19375, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS:
TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

Sequence 24836, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AEROGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AEROGINOSA FOR DIAGNOSTICS AND THERAPEUTICS;
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT HING DATE: 1999-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
SPRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

Sequence 8, Application US/0845819

Patent No. 5795762

GENERAL INFORMATION:
THEORY THEORY STATO 3' EXONUCLEASE MUTATIONS OF TITLE OF INVENTION: THERMOSTABLE DNA POLYMERASES

NUMBER OF SEQUENCES: 38

CORRESPONDENCE ADDRESS:
ADDRESSEE: Hoffmann-La Roche Inc.
STREET: 340 Kingsland Street
CITY: Nutley
STATE: New Jersey
STATE: New Jersey
STATE: New Jersey

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: MordPerfect 2.1

CURRAING SYSTEM: 7

SOFTWARE: WordPerfect 2.1

CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/458,819
